Gene Expression and Regulation Test Online Mcqs. Gene expression is the process by which information from a gene is used in the synthesis of a functional gene product. These products are often proteins, but in non-protein coding genes such as transfer RNA or small nuclear RNA genes, the product is a functional RNA. Most mechanisms that control gene expression do so by controlling transcription, the synthesis of RNA.

Gene expression is the process by which the genetic code – the nucleotide sequence – of a gene is used to direct protein synthesis and produce the structures of the cell. Genes that code for amino acid sequences are known as ‘structural genes’. Gene control regions: A promoter. A region a few hundred nucleotides ‘upstream’ of the gene (toward the 5’ end).

The regulation of gene expression conserves energy and space. It would require a significant amount of energy for an organism to express every gene at all times, so it is more energy efficient to turn on the genes only when they are required. In addition, only expressing a subset of genes in each cell saves space because DNA must be unwound ...
