Simulations can describe the behaviors of complex systems by modeling individual activities and their dynamics. Through virtual experiments, one can instantiate the logic of a theory and replicate true scenarios (Chen & Edgington, 2005). Agent characteristics include autonomy, social ability, reactivity, and proactivity (Gilbert, 2008).

This method is one step ahead by using microscopy that traditionally only gives static information. In addition to new microscopy methods, we used a mathematical model and biochemical experiments to verify the lattice dynamics. Apart from the virus, a major implication of the method is that you can see how molecules move around in a cell.
