### Network Theorems Problems With Solutions

Network Theorems (Part I)-Numerical Problems. Key points: - The problems considered in this set are involving both dependent and independent sources. Following points may be noted Dependent sources are voltage or current sources whose output is function of another parameter in the circuit. Dependent sources only produce a voltage or current when an independent voltage or current source is in the circuit. Dependent sources are treated like independent sources when using nodal or mesh ...

The current through, or voltage across, any element of a network is equal to the algebraic sum of the currents or voltages produced independently by each source. In other words, this theorem allows us to find a solution for a current or voltage using only one source at a time.

Solutions to the problems in Circuit Theory 1. We have the circuit on the right, with a driving voltage  $U_S = 5 \text{ V}$ , and we want to know  $U$  and  $I$ . a.  $R = 1000 \text{ } \Omega$ ; the total resistance in the circuit is then  $R_{\text{tot}} = 1010 \text{ } \Omega$ , and we can use Ohm's law to find  $I = U_S / R_{\text{tot}} = 5 / 1010 \text{ A} = 4.95 \text{ mA}$  and  $U = RI = 4.95 \text{ V}$ . b.

A French engineer, M.L Thevenin, made one of these quantum leaps in 1893. Thevenin's Theorem (also known as Helmholtz-Thévenin Theorem) is not by itself an analysis tool, but the basis for a very useful method of simplifying active circuits and complex networks. This theorem is useful to quickly and easily solve complex linear circuits and networks, especially electric circuits and ...
